

Using the Optimal Partition in Matching and Assignment

Allen Holder

The Hearin Center for Enterprise Science
University of Mississippi

Matching and assignment problems are network optimization models, and these problems are important because they are useful in many situations. We show that the optimal partition, which is provided by an interior-point algorithm, ‘observes’ all optimal solutions to the assignment problem. Moreover, we show that there is a connection between the parametric analysis of the underlying optimization problem and Hall’s Matching Theorem.
