On the semifield planes of order $5^4$ and dimension 2 over the kernel

Minerva Cordero*, The University of Texas at Arlington
Raul Figueroa, The University of Puerto Rico

In this talk we consider the problem of determining all nondesarguesian semifield planes of order $5^4$ and kernel $GF(5^2)$. We show that the class of $p$-primitive planes is the largest class and besides those the only other semifield planes in the class under study are the generalized twisted field planes.
